## Summary

This document describes the dust forecast inter-comparison and model evaluation available in the [Regional Center for Northern Africa, Middle East and Europe \(hereafter RC NAMEE or RC\)](#) of the World Meteorological Organization (WMO) Sand and Dust Storm Warning Advisory and Assessment System (SDS-WAS).

Please, be aware that the document is being revised regularly with the incorporation of the new models and observations. **Last revision is done on 25<sup>th</sup> May 2022.**

## 1. Introduction

The Sand and Dust Storm Warning Advisory and Assessment System (SDS-WAS) is a project of the World Meteorological Organization (WMO) with the mission to enhance the ability of countries to deliver timely and quality sand and dust storm forecasts, observations, information and knowledge to end users. [The Regional Center for Northern Africa, Middle East and Europe \(hereafter RC NAMEE or RC\)](#), hosted by the Spanish State Meteorological Agency (AEMET) and the Barcelona Supercomputing Center (BSC), supports a network of research and operational partners implementing the objectives of the SDS-WAS program in the region.

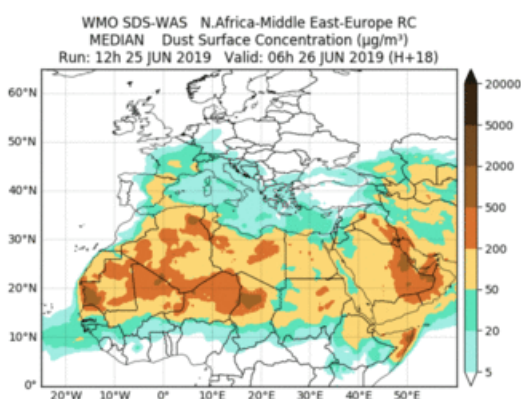

The exchange of forecast model products is recognized as a core part of the WMO SDS- WAS activities, as a key contribution to the RC NAMEE and as a basis for the model inter-comparison and evaluation. The SDS-WAS model inter-comparison and evaluation will make use of a wide range of available datasets describing different aspects of the atmospheric dust cycle. The results of this experiment are expected to **improve the dust parameterization in the individual models and ultimately improve dust forecasts.**

There was a preliminary list of modelling systems providing daily operational or pre-operational dust forecast products. However, it was quite difficult to gather homogeneous products from the different partners and was decided (3rd. and 4th. SDS-WAS RC phone meetings) to start concentration of five models (BSC-DREAM8b, MACC, CHIMERE, LMDzT-INCA, and DREAM-NMME-MACC). Other models have been incorporated throughout the following years.

## 2. Forecast products

### 2.1. General features

The **geographical area of interest** is bounded by the following coordinates: latitude 25°W to 60°E and longitude 0° to 65°N (see Figure 1). It is called the **Reference Area (RA)** and is intended to cover the main source areas in Northern Africa and Middle East, as well as the main transport routes and deposition zones from the equator to the tip of the Scandinavian Peninsula.

*Figure 1: The SDS-WAS Multi-model Median surface concentration dust forecast for 26<sup>th</sup> June 2019 at 6UTC. The domain shown is the Reference Area (RA) is the considered by the RC NAMEE.*

The **variables** to be provided and their corresponding units are:

- Dust aerosol concentration at the surface (SCONC\_DUST), instantaneous ( $\text{kg}\cdot\text{m}^{-3}$ )
- Dust optical depth at 550 nm (AOD550\_DUST), instantaneous (adimensional)

The action will consider forecasts with lead times up to 72 h, based on 00 UTC or 12 UTC runs. The output frequency is of 3 hours. The products shall be daily available, ready for download by the RC team.

## 2.2. Forecasts models

In Table 1, there is listed the models have provided daily dust forecasts to the RC NAMEE.

*Table 1. Overview of the the models that have been contributed to the SDS-WAS multi-model intercomparison since the starting of the RC NAMEE. In red colour, those models that at present, are not providing dust forecasts to the RC NAMEE.*

<i>Data assimilation</i>	No	No	No	Yes, MODIS and VIIRS

### 2.2.1. Numerical data format

The format for data exchange is [NetCDF](#), with one file per model run. The format has been

developed and maintained at [Unidata](#), which is part of the [U. S. University Corporation for Atmospheric Research \(UCAR\)](#). It allows data compression while preserving characteristics of numerical fields that have a very large dynamical range.

The exchanged files meet the following standards:

- One netcdf file with the daily run (at 00 or 12 UTC). The filename is YYYYMMDDHH\_3H\_MODELNAME.nc where YYYYMMDDHH is date and time of the model run and MODELNAME is a name selected by the modeler
- Any regular lat-lon domain
- Two variables: dust surface concentration (SCONC\_DUST) and dust optical depth at 550 nm (OD550\_DUST)
- Forecast time from 0 to 72 hours every 3 hours

The numerical dust forecast outputs are accessible through the [SDS-WAS RC website](#).

### 3. SDS-WAS Multi-model products

The SDS-WAS Multi-model products are generated from the different prediction models. Two products describing centrality (**median** and **mean**) and two products describing spread (standard deviation and range of variation) of the multi-model ensemble are daily computed (Figure 2). In order to generate them, the model outputs are bi-linearly interpolated to a common grid mesh of  $0.5^\circ \times 0.5^\circ$ . Median values ranging from the initial day at 15:00 UTC to the following day at 12:00 UTC are also included in the model intercomparison and the model evaluation.

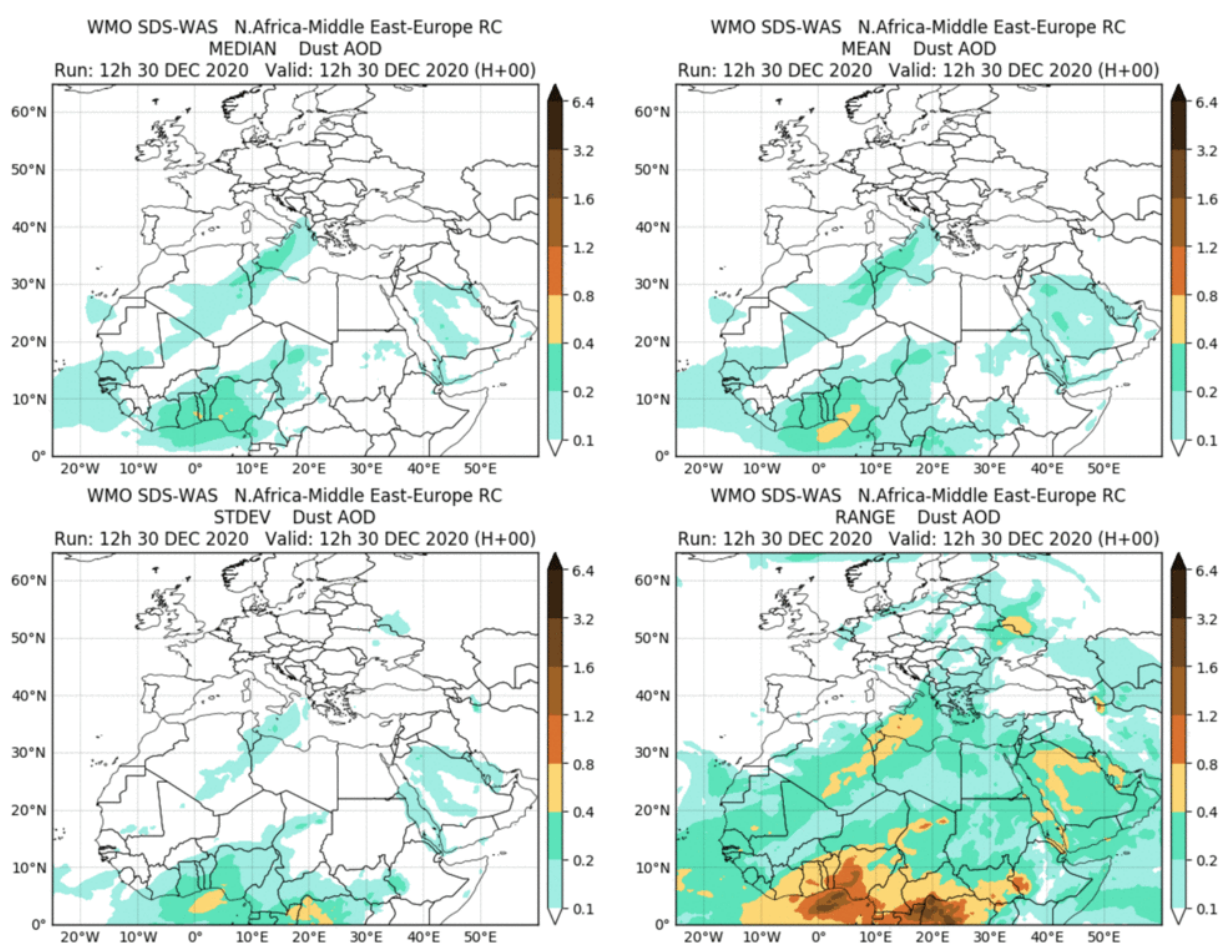

Figure 2: The SDS-WAS ensemble dust optical depth (DOD) forecast for 30<sup>th</sup> December 2020 at 12UTC.

## 4. Forecast visualisation

The values of dust surface concentration and dust optical depth provided by each model are daily plotted side-by-side for the RA using a common color palette (see Table 3 and Figure 3). The palette has been built by combining brownish and greenish colours. The brownish tones highlight the areas with the highest contents of mineral dust whereas the greenish tones allow emphasizing the thresholds set by European Union directives on air quality. An extra color (gray) has been defined for missing data (eventually non-available products or areas outside the integration bounds of limited-area models).

*Table 3: SDS-WAS colour palette to display dust forecasts.*

DOD	0 to 0.1	0.1 to 0.2	0.2 to 0.4	0.4 to 0.8	0.8 to 1.2	1.2 to 1.6	1.6 to 3.2	3.2 to 6.4	> 6.4
Conc, (ug/m <sup>3</sup> )	0 to 5	5 to 20	20 to 50	50 to 200	200 to 500	500 to 2000	2000 to 5000	5000 to 20000	> 20000
Colour									
RGB	255,255,255	161,237,227	92,227,186	252,215,117	218,114,48	158,98,38	113,73,33	57,37,17	29,19,9

The plots are routinely generated and made available at the end of each day using the results of the simulations starting the same day either at 00 or at 12 UTC. In this manner, forecasts released by the models are available for a common period of up to 48 hours, thus making the product a powerful tool to issue short-term predictions and early warning notices. The latest forecasts, as well as historical plots, are available at: <http://sds-was.aemet.es/forecast-products/compared-dust-forecasts>

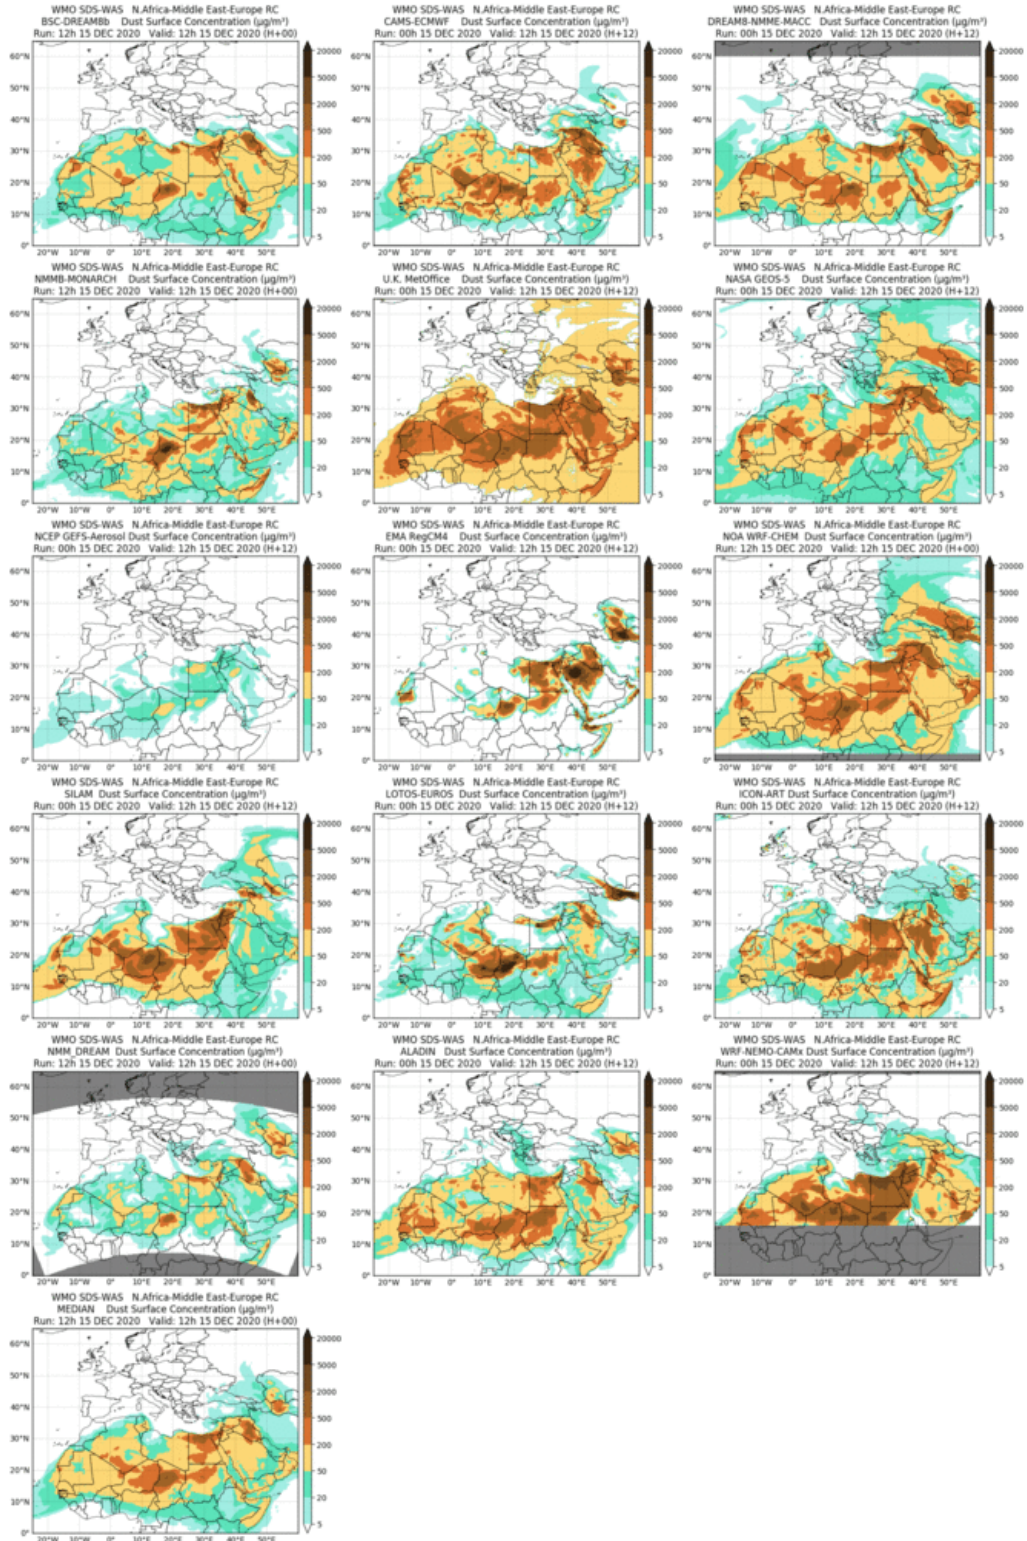

Figure 3: SDS-WAS Multi-model comparison of surface concentration dust forecasts for 30th December 2020 at 12UTC.

## 5. Model evaluation

### 5.1. Observations

The first problem for the evaluation of dust models is the scarcity of routine observations intended for dust monitoring. By the moment, aerosol optical depth (AOD) from sun-photometric measurements and satellite aerosol products are used in the present exercise.

Direct-sun photometric measurements provide retrieval of column-integrated aerosol properties. The [Aerosol Robotic Network \(AERONET\)](#) is a set of stations that provides aerosol retrievals in near-real-time (Holben et al., 1998; Dubovik and King, 2000). A major shortcoming of these measurements is their unavailability under cloudy skies and during nighttime. However, they are by far the most commonly used in dust model evaluation.

Satellite products have the advantage of a large spatial coverage and that measurements are regular and rapidly available. However, they are highly integrated over the column and over all aerosol components. Therefore, applications involving a particular aerosol type (like dust) are usually limited to seasons and regions, when or where that type dominates the aerosol composition (Basart et al, 2012). For the SDS-WAS model evaluation, it is considered the aerosol products from [NASA/MODIS](#). There are different algorithms to retrieve aerosol optical depth (AOD) from the MODIS spectrometer travelling on board the Terra and Aqua satellites.

The U. S. Naval Research Laboratory (NRL) and the University of North Dakota (UND) developed [a value-added NRT AOD product specifically designed for quantitative applications including data assimilation and model validation](#). It is generated every six hours, and time-stamped 00:00, 06:00, 12:00, and 18:00 UTC, including MODIS observations from +/-3 hours from the timestamp and near-real-time available through the NASA's EOSDIS system. It gives values of the total AOD without any information for partitioning between dust and other aerosol species.

Because of the difficulty in separating the signals of aerosols from those of highly reflective surfaces, aerosol retrievals over bright surfaces, such as deserts, have been limited. The MODIS Deep Blue aerosol retrieval algorithm uses the blue channels; where the surface contribution is relatively low, to retrieve aerosol properties over such regions (Hsu et al., 2004; 2006). The mean value of the MODIS Deep Blue aerosol optical depth retrieval is used for the evaluation whereas the mean value of the Angstrom exponent 0.412-0.47  $\mu\text{m}$  is used to identify those areas where mineral dust is the dominant source of atmospheric aerosol. The Deep Blue retrievals are included in [the NASA's Level-3 MODIS Atmosphere Daily Global Product](#). All statistics are sorted into  $1^\circ \times 1^\circ$  cells on an equal-angle global grid.

Since November 2017, the NASA's MODIS aerosol products considered correspond to Collection 6.1.

## 5.2. Evaluation metrics

The common metrics that are used to quantify the mean departure between modelled ( $c_i$ ) and observed ( $o_i$ ) quantities are the mean bias error (BE), the root mean square error (RMSE), the correlation coefficient ( $r$ ) and the fractional gross error (FGE). They are presented in Table 4, where  $n$  denotes the number of data.

Table 4. Summary of the statistical metrics that will be used in the model evaluation.

Statistic Parameter	Formula	Range	Perfect score	Description
Mean Bias Error (BE)	$BE = \frac{1}{n} \sum_{i=1}^n (c_i - o_i)$	$-\infty$ to $+\infty$	0	It captures the average deviations between two datasets. It has the units of the variable. Values near 0 are the best, negative values indicate underestimation and positive values indicate overestimation.
Root Mean Square Error (RMSE)	$RMSE = \sqrt{\frac{1}{n} \sum_{i=1}^n (c_i - o_i)^2}$	0 to $+\infty$	0	It combines the spread of individual errors. It is strongly dominated by the largest values, due to the squaring operation. Especially in cases where prominent outliers occur, the usefulness of RMSE is questionable and the interpretation becomes more difficult.
Correlation coefficient ( $r$ )	$r = \frac{\sum_{i=1}^n (c_i - \bar{c}) \cdot (o_i - \bar{o})}{\sqrt{\sum_{i=1}^n (c_i - \bar{c})^2} \cdot \sqrt{\sum_{i=1}^n (o_i - \bar{o})^2}}$	-1 to 1	1	It indicates the extent to which patterns in the model match those in the observations.
Fractional Gross Error (FGE)	$FGE = \frac{2}{n} \sum_{i=1}^n \left  \frac{c_i - o_i}{c_i + o_i} \right $	0 to 2	0	It is a measure of model error, ranging between 0 and 2 and behaves symmetrically with respect to under- and overestimation, without over-emphasizing outliers.

## 5.3. Evaluation methods

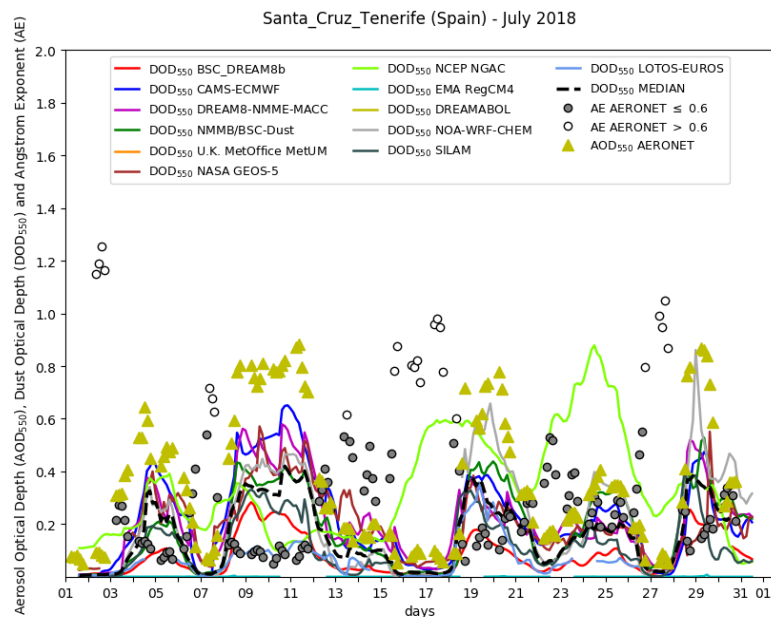

### 5.3.1. Comparison with AERONET

The dust optical depth (DOD) forecast are compared with the total aerosol optical depth (AOD) provided by the AERONET network for a selection of dust-prone stations located in Northern Africa, Middle East and Southern Europe that are listed in **Appendix B**. Since January 2017, **Version 3 Level 1.5 of AERONET products** are used for the near- real-time (NRT) evaluation. AERONET Level 1.5 data are automatically cloud screened but may not have final calibration applied. Before that date, Version 2 products had been used. In [Basart et al. \(2017\)](#) show the comparison between AERONET Version 2 and 3.

Since AERONET sun photometers do not yield AOD at 550 nm (AOD550), this variable is calculated from AOD at 440, 675 and 870 nm (AOD440, AOD675, AOD870) and the Ångström exponent 440-870 (AE440\_870) using the Ångström law:

$$AOD\ 550 = \frac{1}{3} \left( AOD\ 440 \frac{440}{550}^{AE\ 440_{870}} + AOD\ 675 \frac{675}{550}^{AE\ 440_{870}} + AOD\ 870 \frac{870}{550}^{AE\ 440_{870}} \right)$$

To minimize the sources of error, it is intended to restrict the comparison to situations in which mineral dust is the dominant aerosol type. Threshold discrimination is made by discarding observations with an Ångström exponent 440-870 higher than 0.6 (Pérez et al., 2006b).

*Figure 4: SDS-WAS Multi-model comparison of dust optical depth forecasts for July 2018.*

Since January 2017, coinciding with introduction of Version 3 products, AERONET observations are interpolated within 3-hour windows centered at multiple-of-3 hours. Before that date, the closest-in-time retrieval was considered. This resulting dataset is used for the [NRT evaluation](#) (see Figure 4) in which all the dust forecast are compare in the selected AERONET sites and for the calculation of [quantitative scores](#).

To get the performance of the different models participating in this SDS-WAS Multi-model intercomparison, a system to evaluate the performance of the different models has been set. The system yields, on a monthly, seasonal and annual basis, evaluation scores computed from the comparison of the simulated dust optical depth (DOD) and the dust-filtered direct-sun AOD observations from AERONET.

The evaluation system is applied to instantaneous forecast values of DOD ranging from the initial day (D) at 15:00 UTC to the following day (D+1) at 12:00 UTC. It means that the lead times of forecasts to be evaluated range from 15 to 36 hours for model runs starting at 00 UTC, but from 3 to 24 hours for model runs starting at 12 UTC.

The scores of each model and median multi-model are computed for each AERONET site, for the 3 sub-regions (Sahel/Sahara, Middle East and Mediterranean; see [Appendix B](#)) as well as globally considering all sites. It should be noted that scores for individual sites can be little significant for being calculated from a small number of data.

Although observations with an Ångström exponent 440-870 higher than 0.6 are discarded in order to restrict the evaluation to situations in which mineral dust is the dominant aerosol type, other particles are always present (anthropogenic aerosol, products from biomass burning, etc.). Therefore, negative bias can be expected.

### 5.3.2. Comparison with MODIS

The model [evaluation of Saharan dust transport onto the Atlantic](#) uses the MODIS value-added NRT AOD product described in Section 5.1. Since this aerosol product does not provide any information for partitioning between dust and other aerosol species, the evaluation is restricted to an oceanic area, where it is known that mineral dust is by far the main source of atmospheric aerosol. The area, extending between 15° and 30° N and between 18° and 25° W, is the way of Saharan dust out to the Atlantic. As it was the case in the evaluation with AERONET data, although mineral dust is the dominant aerosol in the region, other particles are likely present and, therefore, a negative bias is expected.

- The forecasts of DOD at 12:00 and 18:00 of D+1 are compared with the corresponding MODIS-derived values of AOD. The granules of 00:00 and 06:00 are not used, because neither Terra nor Aqua fly over the area of interest at that times. Model forecasts are bi-linearly interpolated to a 0.5° x 0.5° mesh grid in order to match the spatial resolution of the MODIS retrievals.
- The scores of each model are computed on a monthly, seasonal and annual basis. In the monthly evaluations, model runs between the first and the last day of the month are compared with MODIS retrievals between the second day of the month and the first day of the following month. Only those models that do not use MODIS-derived data in the data assimilation process are considered.

The model [evaluation with MODIS Deep Blue retrievals](#) is based on the Aqua/MODIS Deep Blue products.

- The Aqua satellite turns in a sun-synchronous orbit. Its overpass time is around 12:00 local time in its ascending (daytime) mode. The forecasts of dust optical depth (DOD) at 12:00 of D+1 are compared with the corresponding MODIS-derived values of AOD. The maximum lag between observation and prediction is of 3-4 hours.
- It is intended to restrict the comparison to situations in which mineral dust is the dominant aerosol type. Threshold discrimination is made by discarding observations with a MODIS-retrieved Ångström exponent 412-490nm higher than 1.0. However, besides dust, there might be other aerosol types (anthropogenic source, biomass fire, etc.) and, therefore, a negative bias can be expected in the scores.
- Model forecasts are bi-linearly interpolated to a 1° x 1° mesh grid in order to match the spatial resolution of the MODIS deep blue retrievals. Only those models that are not using MODIS-derived AOD in the data assimilation process are considered in this model evaluation.
- The scores of each model are computed on a monthly, seasonal and annual basis. In the monthly evaluations, model runs between the first and the last day of the

month are compared with MODIS retrievals between the second day of the month and the first day of the following month.

## 7. Appendices

### 7.1. Appendix A: Models description

### 7.1.1. BSC-DREAM8b

<i>Model</i>	BSC-DREAM8b v2.0
<i>Institution</i>	BSC
<i>Meteorological driver</i>	Eta/NCEP
<i>Domain of simulation</i>	0-65°N and 26°W-60°E
<i>Meteorological initial fields</i>	NCEP (GFS)
<i>Emission scheme</i>	Dust uplifting following Shao et al. (1993) using the USGS global 1-km land cover data is used to specify dust productive model points. Include the <i>viscous sublayer</i> approach between the surface and the lowest model layer (Janjic, 1994). This updated version (v2.0) includes a preferential source mask based on Ginoux et al. (2001) in its emission scheme.
<i>Time step</i>	120 s
<i>Horizontal resolution</i>	1/3° x 1/3°
<i>Vertical resolution</i>	24 Eta-layers
<i>Height first layer</i>	86 m (above sea level)
<i>Radiation interactions</i>	Radiation feedbacks described in Pérez et al. (2006a)
<i>Transport size bins</i>	8 bins (0.1-10µm)
<i>Data assimilation</i>	No
<i>Model original coordinates</i>	Eta rotated grid.
<i>Dust outputs parameters</i>	
<i>LOAD_DUST</i>	Total dust concentration for the entire atmospheric column of the model. Directly from the model outputs.
<i>SCONC_DUST</i>	Total dust concentration present in the first model layer above the topography. Directly from the model outputs.
<i>AOD550_DUST</i>	Dust AOD is related to column mass loading by: $AOD(\lambda) = \sum_1^8 AOD_k(\lambda) = \sum_1^8 \frac{3}{4\rho_k r_k} M_k Q_{ext}(\lambda)_k$ <p>where for each size bin <math>k</math>: <math>\rho_k</math> is the particle mass density, <math>r_k</math> is the effective radius, <math>M_k</math> is the column mass loading and <math>Q_{ext}(\lambda)_k</math> is the extinction efficiency factor which was calculated using Mie scattering theory and we have considered the dust refraction indices from OPAC database. The Mie code used has been described in Mischenko et al. (2002).</p>
<i>Model output</i>	File format: NetCDF Grid: Regular Lat-Lon. Linear interpolation. Longitude: 256 grid points (0-65°N vector in inc = 1/3°) Latitude: 196 grid points (26°W-60°E vector in inc = 1/3°) Time: 3-hourly vector starting at 12UTC (with 72h dust forecast) Variables: <i>LOAD_DUST</i> , <i>SCONC_DUST</i> , <i>OD550_DUST</i> , <i>EMI_DUST</i>
<i>References</i>	Nickovic et al. (2001), Pérez et al. (2006a,b), Haustein et al. (2009)

### 7.1.2. CHIMERE

<i>Model</i>	CHIMERE
<i>Institution</i>	LMD
<i>Meteorological driver</i>	WRF
<i>Domain of simulation</i>	North-Atlantic (including Europe and Africa): 100°W -80°E and 5°S -65°N
<i>Meteorological initial fields</i>	NCEP (GFS)
<i>Emission scheme</i>	Marticorena and Bergametti (1995) for saltation. Alfaro and Gomez (2011) (with update of Menut et al., 2005) for sandblasting.
<i>Time step</i>	5mn
<i>Horizontal resolution</i>	1° x 1°
<i>Vertical resolution</i>	30 levels from surface to 200hPa
<i>Height first layer</i>	~40m (above the surface, but coordinates in sigma/pressure, depends on the location and meteorology)
<i>Radiation interactions</i>	No.
<i>Transport size bins</i>	9 bins (mean median diameter from 0.039 to 20µm).
<i>Data assimilation</i>	No.
<i>Model original coordinates</i>	Regular lat/lon.
<i>Dust outputs parameters</i>	
<i>LOAD_DUST</i>	Total dust concentration for the entire atmospheric column of the model. Directly from the model outputs.
<i>SCONC_DUST</i>	Total dust concentration present in the first model layer.
<i>AOD550_DUST</i>	Mass column loading used with a Mie code to compute.
<i>EMI_DUST</i>	Emissions fluxes in g/cm <sup>2</sup> /day
<i>Model output</i>	File format: NetCDF Grid: Regular Lat-Lon. Longitude: 181 grid points (100°W-80°E) Latitude: 71 grid points (5°S-65°N) Time: Hourly outputs with 72h dust forecast starting at 00 of [D-1] Variables: <i>LOAD_DUST</i> , <i>SCONC_DUST</i> , <i>OD550_DUST</i> , <i>EMI_DUST</i>
<i>References</i>	Forêt et al. (2006), Menut (2008), Menut et al. (2005, 2007, 2008, 2009a,b), Vuolo et al. (2009)

### 7.1.3. LMDzT-INCA

<i>Model</i>	LMDzT-INCA
<i>Institution</i>	LSCE
<i>Meteorological driver</i>	LMDzT
<i>Domain of simulation</i>	Global
<i>Meteorological initial fields</i>	ECMWF-IFS
<i>Emission scheme</i>	Dust uplifting following Schulz et al. (1998), Guelle et al., (2000), Schulz (2007) using soil texture, soil humidity, maps of potential source strength and threshold velocity derived from FAO soil maps.
<i>Time step</i>	30 minutes
<i>Horizontal resolution</i>	3.75° x 2.85°
<i>Vertical resolution</i>	19 sigma-hybrid-layers
<i>Height first layer</i>	120 m (above surface)
<i>Radiation interactions</i>	No in forecast mode ( potentially yes)
<i>Transport size bins</i>	1- log normal mode, mass and number (width 2, MMD 1.5-2.5 µm)
<i>Data assimilation</i>	No
<i>Model original coordinates</i>	regular Lat-Lon
<i>Dust outputs parameters</i>	
<i>LOAD_DUST</i>	Directly from model output
<i>SCONC_DUST</i>	Directly from model output
<i>AOD550_DUST</i>	Dust AOD is function of local MMD, refractive index and aerosol mass.
<i>Model output</i>	File format: NetCDF Grid: Regular Lat-Lon Longitude: as documented in netCDF file Latitude: as documented in netCDF file, 1/2 degree at poles Time: 3-hourly for 72 hours into future starting at 00UTC. Variables: <i>LOAD_DUST</i> , <i>SCONC_DUST</i> , <i>OD550_DUST</i> , <i>EMI_DUST</i>
<i>References</i>	Balkanski et al. (2006), Huneus et al. (2011), Guelle et al. (2000), Schulz (2007) , Schulz et al. (1998, 2009)

#### 7.1.4. CAMS

<i>Model</i>	CAMS
<i>Institution</i>	ECMWF
<i>Meteorological driver</i>	ECMWF
<i>Domain of simulation</i>	Global
<i>Meteorological initial fields</i>	ECMWF/IFS
<i>Emission scheme</i>	Dust uplifting following Ginoux et al. (2001) and Morcrette et al. (2008, 2009).
<i>Time step</i>	1800s
<i>Horizontal resolution</i>	8-10 km approx. (O1280)
<i>Vertical resolution</i>	137 $\sigma$ -layers
<i>Height first layer</i>	10 m (above the surface)
<i>Radiation interactions</i>	No.
<i>Transport size bins</i>	3 bins (0.03 - 0.55 - 0.9 - 20 $\mu$ m)
<i>Data assimilation</i>	Yes. (Benedetti et al., 2009)
<i>Model original coordinates</i>	IFS reduced-Gaussian grid (Hortal and Simmons, 1991)
<i>Dust outputs parameters</i>	
<i>LOAD_DUST</i>	Total dust concentration for the entire atmospheric column of the model. Directly from the model outputs.
<i>SCONC_DUST</i>	Total dust concentration present in the first model layer above the topography. Directly from the model outputs.
<i>AOD550_DUST</i>	Dust AOD is related to column mass loading and the dust refraction indices from Kinne. The Mie code used has been described in Toon and Ackerman (1981).
<i>Model output</i>	File format: NetCDF Grid: Regular Lat-Lon. Linear interpolation to 1° x 1° Longitude: 360 grid points Latitude: 180 grid points Time: 3-hourly vector starting at 00UTC Variables: <i>LOAD_DUST</i> , <i>SCONC_DUST</i> , <i>OD550_DUST</i> , <i>EMI_DUST</i>
<i>References</i>	Benedetti et al. (2008), Hortal et al. (2009), Morcrette et al. (2008, 2009)

### 7.1.5. DREAM8-NMMB-MACC

<i>Model</i>	DREAM8-NMME-MACC
<i>Institution</i>	SEEVCCC
<i>Meteorological driver</i>	NMME
<i>Domain of simulation</i>	0-60°N and 25°W-45°E
<i>Meteorological initial fields</i>	ECMWF
<i>Emission scheme</i>	Dust uplifting following Shao et al. (1993) using the USGS global 1-km land cover data is used to specify dust productive model points. Include the viscous sublayer approach between the surface and the lowest model layer (Janjic, 1994).
<i>Time step</i>	120 s
<i>Horizontal resolution</i>	1/3° x 1/3°
<i>Vertical resolution</i>	28 hybrid layers
<i>Height first layer</i>	48 m above sea level (approx.)
<i>Radiation interactions</i>	No at the moment
<i>Transport size bins</i>	8 bins (0.1-10µm)
<i>Data assimilation</i>	ECMWF-dust-analysis at 18:00 UTC is used as a target field to which 6-hour nudging is done with Newtonian relaxation assimilation.
<i>Model original coordinates</i>	Eta rotated grid.
<i>Dust outputs parameters</i>	
<i>LOAD_DUST</i>	Total dust concentration for the entire atmospheric column of the model. Directly from the model outputs.
<i>SCONC_DUST</i>	Total dust concentration present in the first model layer above the topography. Directly from the model outputs.
<i>AOD550_DUST</i>	<p>Dust AOD is related to column mass loading by:</p> $AOD(\lambda) = \sum_1^8 AOD_k(\lambda) = \sum_1^8 \frac{3}{4\rho_k r_k} M_k Q_{ext}(\lambda)_k$ <p>where for each size bin <math>k</math>: <math>\rho_k</math> is the particle mass density, <math>r_k</math> is the effective radius, <math>M_k</math> is the column mass loading and <math>Q_{ext}(\lambda)_k</math> is the extinction efficiency factor which was calculated using Mie scattering theory and we have considered the dust refraction indices from OPAC database. The Mie code used has been described in Mischenko et al. (2002).</p>
<i>Model output</i>	<p>File format: NetCDF, GRIB</p> <p>Grid: Regular Lat-Lon. Bi-linear interpolation. Longitude: 481 grid points (5-60°N vector in inc = 1/4°) Latitude: 251 grid points (50°W-70°E vector in inc = 1/4°)</p> <p>Time: 3-hourly vector starting at 12UTC (with 72h dust forecast) with one day delay, depends on ECMWF-dust-analysis availability Variables: <i>LOAD_DUST</i>, <i>SCONC_DUST</i>, <i>AOD550_DUST</i>, <i>EMI_DUST</i></p>
<i>References</i>	Nickovic et al. (2001), Nickovic (2004), Benedeti et al, (2008), Pejanovic et al (2010), Xie et al. (2008)

### 7.1.6. NMMB-MONARCH

<i>Model</i>	NMMB-MONARCH (the mineral dust module is also known as NMMB/BSC-Dust)
<i>Institution</i>	BSC
<i>Meteorological driver</i>	NMMB/NCEP
<i>Domain of simulation</i>	10°S-66°N and 33°W-68°E
<i>Meteorological initial fields</i>	NCEP (GFS)
<i>Emission scheme</i>	Dust uplifting following Marticorena and Bergametti (1995) using the USGS global 1-km land cover database, the high resolution NESDIS 5-years monthly climatology of vegetation fraction, and topographic preferential source mask of Ginoux to specify dust productive model points. Include the <i>viscous sublayer</i> approach between the surface and the lowest model layer (Janjic, 1994).
<i>Time step</i>	80 s
<i>Horizontal resolution</i>	1/3° x 1/3°
<i>Vertical resolution</i>	24 hybrid pressure-sigma layers
<i>Height first layer</i>	108 m (above sea level)
<i>Radiation interactions</i>	Radiation feedbacks described in Pérez et al. (2006a), not activated
<i>Transport size bins</i>	8 bins (0.1-10µm)
<i>Data assimilation</i>	No
<i>Model original coordinates</i>	NMMB rotated grid.
<i>Dust outputs parameters</i>	
<i>LOAD_DUST</i>	Total dust concentration for the entire atmospheric column of the model. Directly from the model outputs.
<i>SCONC_DUST</i>	Total dust concentration present in the first model layer above the topography. Directly from the model outputs.
<i>AOD550_DUST</i>	Dust AOD is related to column mass loading by: $AOD(\lambda) = \sum_1^8 AOD_k(\lambda) = \sum_1^8 \frac{3}{4\rho_k r_k} M_k Q_{ext}(\lambda)_k$ <p>where for each size bin <math>k</math>: <math>\rho_k</math> is the particle mass density, <math>r_k</math> is the effective radius, <math>M_k</math> is the column mass loading and <math>Q_{ext}(\lambda)_k</math> is the extinction efficiency factor which was calculated using Mie scattering theory and we have considered the dust refraction indices from OPAC database. The Mie code used has been described in Mischenko et al. (2002).</p>
<i>Model output</i>	File format: NetCDF Grid: Regular Lat-Lon. Linear interpolation. Longitude: 289 grid points (10°S-66°N vector in inc = 1/3°) Latitude: 211 grid points (33°W-68°E vector in inc = 1/3°) Time: 3-hourly vector starting at 12UTC (with 72h dust forecast) Variables: <i>SCONC_DUST</i> , <i>OD550_DUST</i>
<i>References</i>	Pérez et al. (2011), Haustein et al. (2011)

### 7.1.7. MetUM

<i>Model</i>	MetUM <sup>TM</sup> (global NWP configuration of Met Office Unified Model)
<i>Institution</i>	UK Met Office
<i>Meteorological driver</i>	MetUM
<i>Domain of simulation</i>	Global ( but data provided over sub-domain: 60W to 55E,0 to 70N)
<i>Meteorological initial fields</i>	MetUM
<i>Emission scheme</i>	Simplified 2-bin version of Woodward et al. (2001, 2011). Horizontal flux is calculated across 9 bins (0.03-1000 $\mu\text{m}$ ) as in Woodward (2011) but vertical flux is emitted into 2 bins only using a prescribed size distribution (instead of the original 6 bins).
<i>Time step</i>	10 mins
<i>Horizontal resolution</i>	0.3516°x0.2344°
<i>Vertical resolution</i>	70 levels from surface to 80km (uses terrain-following staggered Charney- Phillips grid)
<i>Height first layer</i>	~ 20m (theta) and ~10 m (u,v,p, $\rho$ ) above surface
<i>Radiation interactions</i>	No (possible but not currently activated).
<i>Transport size bins</i>	2 bins (0.1-2 $\mu\text{m}$ , 2-10 $\mu\text{m}$ )
<i>Data assimilation</i>	MODIS/Aqua
<i>Model original coordinates</i>	Regular lat-lon
<i>Dust outputs parameters</i>	
<i>SCONC_DUST</i>	Total dust concentration present in the first model layer. Directly from the model outputs.
<i>AOD550_DUST</i>	Mass column loading used with a Mie code (offline) to compute dust extinction coefficients. Dust refractive indices are taken from Balkanski et al (2007).
<i>Model output</i>	File format: NetCDF Grid: Regular Lat-Lon. Longitude: 327 grid points Latitude: 299 grid points Time: 3-hourly vector starting at 00UTC Variables (currently providing): <i>SCONC_DUST</i> , <i>OD550_DUST</i>
<i>References</i>	Woodward, S (2011), Mineral dust in HadGEM2, Tech. Note 87, Hadley Cent., Met Office, Exeter, UK. Woodward, S. (2001), Modeling the atmospheric life cycle and radiative impact of mineral dust in the Hadley Centre climate model, <i>J. Geophys. Res.</i> , 106, D16, doi:10.1029/2000JD900795

### 7.1.8. GEOS-5

<i>Model</i>	GEOS-5 Earth System Model
<i>Institution</i>	NASA/Goddard Space Flight Center/Global Modeling and Assimilation
<i>Meteorological driver</i>	Aerosols are transported within the GEOS-5 global model
<i>Domain of simulation</i>	Global
<i>Meteorological initial fields</i>	GEOS-5 Atmospheric Data Assimilation System
<i>Emission scheme</i>	Based on Ginoux (2001)
<i>Time step</i>	Aerosol tendencies computed every 30 minutes
<i>Horizontal resolution</i>	0.25 degree longitude by 0.3125 degree latitude
<i>Vertical resolution</i>	72 vertical layers, model top at 0.01 hPa (~85 km)
<i>Height first layer</i>	
<i>Radiation interactions</i>	Aerosol direct effects on radiation fully included.
<i>Transport size bins</i>	5 bins centered at (0.73 $\mu\text{m}$ , 1.4 $\mu\text{m}$ , 2.4 $\mu\text{m}$ , 4.5 $\mu\text{m}$ , 8.0 $\mu\text{m}$ )
<i>Data assimilation</i>	Data sources: MODIS Aqua/Terra reflectances, Neural Net AOD retrieval Analysis algorithm: 3-hourly analysis splitting consisting of a 2D AOD analysis and 3D increments based on local displacement ensembles.
<i>Model original coordinates</i>	Constant longitude/latitude grid; shortly switching to cubed-sphere
<i>Dust outputs parameters</i>	
<i>DUSMASS</i>	dust surface mass concentration. Dust concentration, summed over the 5 bins, for the first model layer above the surface
<i>DUEXTTAU</i>	dust extinction aot [550 nm]. Computed online based on mass extinction coefficients look up tables. Optical properties based on Colarco et. al. (2002), Kim et al. (2011) and Levoni et al. (1997). Spheroidal shape distribution after Dubovik et al. (2006), properties calculated after Meng et al. (2010).
<i>Model output</i>	File format: COARDS (CF 1.0) compliant NetCDF-4 files Grid: Regular Lat-Lon. Longitude: 1152 grid points (180W-179.6875E, increment: 0.3125°) Latitude: 721 grid points (90S-90N, increment: 0.25 deg) Time: hourly vector starting at OUTC (with 5 day dust forecast) Variables: <i>SCONC_DUST</i> , <i>OD550_DUST</i>
<i>References</i>	Colarco, P., A. da Silva, M. Chin and T. Diehl, 2009: Online simulations of global aerosol distributions in the NASA GEOS-4 model and comparisons to satellite and ground-based aerosol optical depth. <i>J. Geophys. Res.</i> , 115, D14207, doi:10.1029/2009JD012820. Nowottnick, E., P. Colarco, A. da Silva, 2011: The Fate of Saharan Dust Across the Atlantic and Implications for a Central American Dust Barrier. <i>Atmos. Chem. Phys.</i> , 11, 8415-8431, doi:10.5194/acp-11-8415-2011.

### 7.1.9. NGAC

<i>Model</i>	NCEP NEMS GFS Aerosol Component (NGAC)
<i>Institution</i>	NOAA NCEP
<i>Meteorological driver</i>	NEMS GFS
<i>Domain of simulation</i>	Global
<i>Meteorological initial fields</i>	NCEP GDAS
<i>Emission scheme</i>	Dust uplifting following Ginoux (2001)
<i>Time step</i>	450 seconds
<i>Horizontal resolution</i>	T126 (- 1 deg )
<i>Vertical resolution</i>	64 vertical sigma-pressure hybrid layers, model top at 0.2 hPa
<i>Height first layer</i>	- 20 m
<i>Radiation interactions</i>	Aerosol direct effects on radiation not currently activated
<i>Transport size bins</i>	5 bins centered at (0.73 $\mu\text{m}$ , 1.4 $\mu\text{m}$ , 2.4 $\mu\text{m}$ , 4.5 $\mu\text{m}$ , 8.0 $\mu\text{m}$ )
<i>Data assimilation</i>	No
<i>Model original coordinates</i>	GFS reduced Gaussian grids
<i>Dust outputs parameters</i>	
<i>DUSMASS</i>	dusmass dust surface mass concentration. Dust concentration, summed over the 5 bins, for the first model layer above the surface
<i>DUEXTTAU</i>	dust extinction aod [550 nm]. Computed offline based on mass extinction coefficients look up tables.
<i>Model output</i>	File format: GRIB2 Grid: Regular lat-lon. Linear interpolation to 1° x 1° Longitude: 360 grid points, Latitude: 180 grid points Time: 3-hourly vector starting at OUTC (with 5 day dust forecast). Variables: <i>SCONC_DUST</i> , <i>AOD550_DUST</i>
<i>References</i>	Lu et al., 2010: Development of NCEP Global Aerosol Forecasting System: An overview and its application for improving weather and air quality forecasts, NATO Science for Peace and Security Series: Air Pollution Modeling and Its Application XX, 451-454, doi:10.1007/978-90-481-3812-8.  Lu, C.-H., da Silva, A., Wang, J., Moorthi, S., Chin, M., Colarco, P., Tang, Y., Bhattacharjee, P. S., Chen, S.-P., Chuang, H.-Y., Juang, H.-M. H., McQueen, J., and Iredell, M. (2016): The implementation of NEMS GFS Aerosol Component (NGAC) Version 1.0 for global dust forecasting at NOAA/NCEP, Geosci. Model Dev., 9, 1905-1919, doi:10.5194/gmd-9-1905-2016.

### 7.1.10. EMA RegCM4

<i>Model</i>	EMA-RegCM4
<i>Institution</i>	EMA
<i>Meteorological driver</i>	Online dust scheme with the Regional Climate Model version 4 (RegCM4)
<i>Domain of simulation</i>	Regional
<i>Meteorological initial fields</i>	NCEP/GFS
<i>Emission scheme</i>	Saltation and sandblasting process (A.S. Zakey 2006), the dust scheme depends on (Marticorena and Bergametti, 1995; Alfaro and Gomes, 2001)
<i>Time step</i>	150 s
<i>Horizontal resolution</i>	45 km x 45 km
<i>Vertical resolution</i>	18 sigma-layers
<i>Height first layer</i>	50 m
<i>Radiation interactions</i>	Yes ( both with shortwave and long waves) (Direct effects)
<i>Transport size bins</i>	4 bins(0.01:1 - 1:2.5 - 2.5:5 - 5:20)
<i>Data assimilation</i>	No
<i>Model original coordinates</i>	Arakawa-Lamb B-staggering
<i>Dust outputs parameters</i>	
<i>LOAD_DUST</i>	Total dust concentration for the entire atmospheric column of the model. Directly from the model outputs.
<i>SCONC_DUST</i>	Total dust concentration present in the first model layer above the topography. Directly from the model outputs.
<i>OD550_DUST</i>	AOD is related to column mass loading and the considered dust refraction indices from Kinne. The Mie code used has been described in Toon and Ackerman (1981).
<i>Model output</i>	File format: NetCDF Grid: Lambert Conformal projection Longitude: 240 grid points Latitude: 180 grid points Time: 3-hourly vector starting at 03UTC Variables: <i>LOAD_DUST</i> , <i>SCONC_DUST</i> , <i>OD550_DUST</i>
<i>References</i>	A. S. Zakey, F. Solmon, and F. Giorgi, (2006) "Implementation and testing of a desert dust module in a regional climate model", Atmos. Chem. Phys., 6, 4687-4704.

### 7.1.11. DREAMBOL

<i>Model</i>	DREAMABOL v1.0
<i>Institution</i>	CNR-ISAC
<i>Meteorological driver</i>	BOLAM
<i>Domain of simulation</i>	0-65°N and 25°W-60°E
<i>Meteorological initial fields</i>	NCEP (GFS)
<i>Emission scheme</i>	Dust uplift following Tegen et al. (1994) using the USGS global 1-km land cover data to specify dust productive model points and FAO soil database for availability of uplifted species. Uses surface TKE based uplift velocity to account for strong convective conditions. Includes a preferential source mask based on Ginoux et al. (2001).
<i>Time step</i>	240 s
<i>Horizontal resolution</i>	0.4° x 0.4° in rotated pole lon-lat grid.
<i>Vertical resolution</i>	50 sigma-hybrid-levels, up to 0.01 hPa
<i>Height first layer</i>	27 m (above surface) at sea level.
<i>Radiation interactions</i>	Based on the substitution of climatological values with the actual model dust AOD in the radiation scheme by Morcrette (1991). Not yet active in operational mode.
<i>Transport size bins</i>	8 bins (0.1-10 µm)
<i>Data assimilation</i>	No
<i>Model original coordinates</i>	Rotated pole lon-lat grid: north_pole_longitude = -162.5, north_pole_latitude=57.5.
<i>Dust outputs parameters</i>	
<i>LOAD_DUST</i>	Total dust concentration for the entire atmospheric column of the model. Directly from the model output.
<i>SCONC_DUST</i>	Total dust concentration present in the first model layer above the topography. Directly from the model output.
<i>EMI_DUST</i>	Emissions fluxes sampled at the output time step (not cumulated). Directly from the model output.
<i>OD550_DUST</i>	Computed run-time, level-by-level, using an approximation of Mie theory (Evans and Fournier, 1990) to compute the extinction coefficient and approximating of the actual particle distribution by a lognormal distribution with the same parameters.
<i>Model output</i>	File format: NetCDF. Grid: model output is interpolated onto the Model Ensemble grid: Longitude: 171 grid points (0-65°N vector in inc = 0.5°), Latitude: 131 grid points (25°W-60°E vector in inc = 0.5°). Time: 3-hourly steps starting at 00UTC (72h forecast) Variables: <i>LOAD_DUST</i> , <i>SCONC_DUST</i> , <i>OD550_DUST</i> , <i>EMI_DUST</i>

### 7.1.12. WRF-CHEM

<i>Model</i>	WRF-CHEM
<i>Institution</i>	NOA
<i>Meteorological driver</i>	WRF
<i>Domain of simulation</i>	2-70°N and 28°W-66°E
<i>Meteorological initial fields</i>	GFS
<i>Emission scheme</i>	Gocart scheme by Ginoux et al. (2001)
<i>Time step</i>	60 s
<i>Horizontal resolution</i>	0.19° x 0.22°
<i>Vertical resolution</i>	30 sigma levels
<i>Height first layer</i>	
<i>Radiation interactions</i>	No at the moment
<i>Transport size bins</i>	8 bins (0.15, 0.25, 0.45, 0.78, 1.3, 2.2, 3.8, 7.1µm)
<i>Data assimilation</i>	No
<i>Model original coordinates</i>	Lon-lat standard grid.
<i>Dust outputs parameters</i>	
<i>LOAD_DUST</i>	Total dust concentration for the entire atmospheric column of the model. Directly from the model outputs.
<i>SCONC_DUST</i>	Total dust concentration present in the first model layer above the topography. Directly from the model outputs.
<i>OD550_DUST</i>	Dust AOD is related to column mass loading and considered dust refraction indices.
<i>Model output</i>	File format: NetCDF Grid: Regular Lat-Lon. Longitude: 424 grid points Latitude: 348 grid points Time: 3-hourly vector starting at 12UTC (with 72h dust forecast) Variables: <i>SCONC_DUST</i> , <i>OD550_DUST</i>
<i>References</i>	In preparation

### 7.1.13. SILAM

<i>Model</i>	SILAM
<i>Institution</i>	Finnish Meteorological Institute
<i>Meteorological driver</i>	ECMWF/IFS
<i>Domain of simulation</i>	Global -to- $\gamma$ -mesoscale. Dust forecasts are provided from the global domain
<i>Meteorological initial fields</i>	ECMWF/IFS
<i>Emission scheme</i>	Saltation and sandblasting following Marticorena & Bergametti, (1995), Zender, (2003) with several updates. The sandblasting efficiency is refitted from original Gillette (1979) observations. Critical $u^*$ equation was reanalyzed, variables split and an approximate analytical solution found, Size spectrum is after Weinzierl (2007), roughness length is from wind scatterometer after Prigent et al., (2007)
<i>Time step</i>	1200s
<i>Horizontal resolution</i>	0.5° x 0.5°
<i>Vertical resolution</i>	29 hybrid $\sigma$ -pressure layers
<i>Height first layer</i>	-25 m (above the surface at the sea level)
<i>Radiation interactions</i>	No.
<i>Transport size bins</i>	5 bins (0.1-1, 1-2.5, 2.5-10, 10-30 $\mu$ m)
<i>Data assimilation</i>	No
<i>Model original coordinates</i>	Regular lon-lat
<i>Dust outputs parameters</i>	
<i>LOAD_DUST</i>	Total dust concentration for the entire atmospheric column of the model. Directly from the model outputs. Post-processing, available on request.
<i>CONC_DUST</i>	Total dust concentration in the first model layer. Available as a layer of a 3D field directly from the model outputs.
<i>OD550_DUST</i>	AOD is related to column mass loading and the dust refraction indices from Kinne. The Mie code used has been described in Toon and Ackerman (1981). AOD of each mode available from model outputs. Total dust AOD is a result of post-processing.
<i>EMI_DUST</i>	Dust emission in kg/cell. Can be enabled in the model outputs on request.
<i>Model output</i>	File format: NetCDF4 Grid: Regular Lat-Lon. 0.5° x 0.5° Longitude: 720 grid points Latitude: 359 grid points Time: hourly-averaged, starting at 00UTC up to +120 hours Variables: <i>LOAD_DUST</i> , <i>CONC_DUST</i> , <i>OD550_DUST</i> , <i>EMI_DUST</i>
<i>References</i>	Sofiev et al (2015), Hongisto & Sofiev, (2005). Description of the current dust emission scheme is under preparation

#### 7.1.14. LOTOS-EUROS

<i>Model</i>	LOTOS-EUROS
<i>Institution</i>	TNO
<i>Meteorological driver</i>	ECMWF
<i>Domain of simulation</i>	0-65 °N and 25°W-65°E
<i>Meteorological initial fields</i>	ECMWF
<i>Emission scheme</i>	GLC land cover map, STATSGO soil texture map, potential sources approach by Ginoux et al (2001). Approach by Marticorena& Bergametti 1995, impact of clay fraction by Fécan et al (1999) with modification as in Mokthari et al (2012). Dust uplifting following Shao et al. (2001).
<i>Time step</i>	Variable, depends on Courant conditions
<i>Horizontal resolution</i>	1/2° x 1/4° (lon x lat)
<i>Vertical resolution</i>	4 dynamical layers + surface layer
<i>Height first layer</i>	25 m above terrain
<i>Radiation interactions</i>	No
<i>Transport size bins</i>	5 bins (0.1-10µm)
<i>Data assimilation</i>	no
<i>Model original coordinates</i>	Regular lon-lat
<i>Dust outputs parameters</i>	
<i>SCONC_DUST</i>	Translation of dust in first model layer to observation height (2.5 m above terrain) using constant flux approach (direct model output)
<i>OD550_DUST</i>	AOD is calculated per layer based on mass extinction coefficients for concentrations per size bin, then summed to obtain total column AOD
<i>Model output</i>	File format: NetCDF Grid: Regular Lat-Lon. Time: 3-hourly vector starting at 00 UTC (with 72h dust forecast) with one day delay, depends on ECMWF-dust-analysis availability Variables: <i>SCONC_DUST</i> , <i>OD550_DUST</i>
<i>References</i>	LOTOS-EUROS v2.0 reference guide, 2016 A.M.M. Manders and S. Janson, <i>Modelling of mineral dust in the Sahara region</i> , TNO report TNO2014 R11118, 2014 Both available at <a href="http://www.lotos-euros.nl">www.lotos-euros.nl</a>

### 7.1.15. ICON-ART

<i>Model</i>	ICON-ART
<i>Institution</i>	DWD + KIT
<i>Meteorological driver</i>	DWD
<i>Domain of simulation</i>	Global with two-way nest (0 -82°N,68°W-68°E)
<i>Meteorological initial fields</i>	From own data assimilation cycle
<i>Emission scheme</i>	Saltation and threshold friction velocity for dust emission flux; HWSD for soil types (Rieger et al., 2017; Vogel et al., 2006; White, 1979; Shao and Lu, 2000; Alfaro and Gomes, 2001)
<i>Time step</i>	Global: 6 minutes, nest: 3 minutes
<i>Horizontal resolution</i>	40 km global + 20 km two-way nest over Europe, North Atlantic and North Africa. Triangular mesh based on an icosahedron.
<i>Vertical resolution</i>	90 (global) and 60 (nest) Smooth Level Vertical SLEVE coordinate (Leuenberger 2010)
<i>Height first layer</i>	10 m (above the surface) for global and nest
<i>Radiation interactions</i>	Radiation feedback (direct and semi-direct effect) described in Rieger et al. (2017) and in Gasch et al. (2017)
<i>Transport size bins</i>	3-log normal modes for mass and number concentration
<i>Data assimilation</i>	Yes, same observations as in operational ICON at DWD. Prognostic dust is included in first guess of DA cycle, but so far no assimilation of dust observations is done.
<i>Model original coordinates</i>	Triangular grid
<i>Dust outputs parameters</i>	
<i>SCONC_DUST</i>	Total dust mass concentration present in the first model layer above the topography.
<i>OD550_DUST</i>	AOD is calculated per layer based on mass extinction coefficients for mass concentrations per mode, then summed to obtain total column AOD.
<i>Model output</i>	File format: NetCDF Grid: Regular Lat-Lon of nest region. Linear interpolation to 1/16° x 1/16° Longitude: 1041 grid points Latitude: 1361 grid points Time: 6-hourly vector starting at 00 UTC Variables: SCONC_DUST, OD550_DUST
<i>References</i>	Rieger et al. (2017), Gasch et al. (2017), Rieger et al. (2015), Zängl et al. (2015), Vogel et al. (2006)

### 7.1.16. DREAM8-NMME-MSG

<i>Model</i>	DREAM-NMME-MSG
<i>Institution</i>	IAASARS/NOA
<i>Meteorological driver</i>	NMME
<i>Domain of simulation</i>	0° -55° N , 40° W -80° E
<i>Meteorological initial fields</i>	NCEP/GFS
<i>Emission scheme</i>	Dust uplifting following Shao et al. (1993) and Nickovic et al., 2001. Includes the viscous sublayer approach between the surface and the lowest model layer (Janjic, 1994).
<i>Time step</i>	72 s
<i>Horizontal resolution</i>	1/5° x 1/5°
<i>Vertical resolution</i>	28 hybrid layers
<i>Height first layer</i>	50 m above sea level (approx.)
<i>Radiation interactions</i>	No
<i>Transport size bins</i>	8 bins (0.1-10µm)
<i>Data assimilation</i>	MSG-SEVIRI at 12:00 UTC is used as a target field to which 6-hour nudging is done with Newtonian relaxation assimilation (Pejanovic et al, 2010; Solomos et al., 2017)
<i>Model original coordinates</i>	Eta rotated grid.
<i>Dust outputs parameters</i>	
<i>SCONC_DUST</i>	Total dust concentration present in the first model layer above the topography. Directly from the model output.
<i>OD550_DUST</i>	The dust optical depth is related to column mass loading by: $AOD(\lambda) = \sum_1^8 AOD_k(\lambda) = \sum_1^8 \frac{3}{4\rho_k r_k} M_k Q_{ext}(\lambda)_k$ <p>where for each size bin k: <math>\rho_k</math> is the particle mass density, <math>r_k</math> is the effective radius, <math>M_k</math> is the column mass loading and <math>Q_{ext}(\lambda)_k</math> is the extinction efficiency factor which was calculated using Mie scattering theory and we have considered the dust refraction indices from OPAC database. The Mie code used has been described in Mischenko et al. (2002).</p>
<i>Model output</i>	NetCDF Regular Lat-Lon. Bi-linear interpolation. Longitude: 701 grid points (5°S-70°N vector in inc = 1/5°) Latitude: 370 grid points (50°W-90°E vector in inc = 1/5°) 3-hourly vector starting at 06UTC (with 72h dust forecast) with one day delay, depends on MSG-SEVIRI dust optical depth availability Variables: <i>SCONC_DUST</i> , <i>OD550_DUST</i>
<i>References</i>	Nickovic et al. (2001), Pejanovic et al (2010), Solomos et al. (2017)

### 7.1.17. ALADIN-Dust

<i>Model</i>	ALADIN-Dust
<i>Institution</i>	ONM-Algeria (ALADIN consortium)
<i>Meteorological driver</i>	ALADIN
<i>Domain of simulation</i>	Regional
<i>Meteorological initial fields</i>	ARPEGE
<i>Emission scheme</i>	The dust fluxes are calculated using the Dust Entrainment And Deposition (DEAD) model (Zender et al., 2003). The physical parameterizations in the DEAD scheme are based on the Marticorena and Bergametti (1995) scheme, in which dust is calculated as a function of saltation and sandblasting. DEAD was implemented in the ISBA scheme embedded in SURFEX (Grini et al., 2006). Recently this emission parameterization has been improved by Mokhtari et al. (2012) in order to better account for the soil aggregate distribution.
<i>Time step</i>	420s
<i>Horizontal resolution</i>	25km x 25km
<i>Vertical resolution</i>	70 $\sigma$ -layers
<i>Height first layer</i>	65m (approx.)
<i>Radiation interactions</i>	Yes, the Fouquart and Morcrette radiation scheme (FMR; Morcrette, 1989).
<i>Transport size bins</i>	Log-normal (mode, mass and number) with 3 bins (0.078-5 $\mu$ m)
<i>Data assimilation</i>	No
<i>Model original coordinates</i>	ALADIN rotated grid
<i>Dust outputs parameters</i>	
<i>SCONC_DUST</i>	Total dust concentration present in the first model level, directly from the model outputs.
<i>OD550_DUST</i>	Mass column loading used with a Mie code to compute.
<i>Model output</i>	File format: FA (Form ARPEGE), converted to NetCDF to meet SDSWAS technical requirements. Grid: Regular Lat-Lon Longitude: 342 grid points Latitude: 262 grid points Time: 3-hourly vector starting at 00UTC (with 72h dust forecast) Variables provided: SCONC_DUST, OD550_DUST
<i>References</i>	Zender et al. (2003), Grini et al. (2006), Mokhtari et al. (2012), Mokhtari et al. (2015), P. Termonia et al. (2018).

### 7.1.18. WRF-NEMO-CAMx

<i>Model</i>	WRF-N.E.MO.-CAMx
<i>Institution</i>	Aristotle University of Thessaloniki
<i>Meteorological driver</i>	WRF
<i>Domain of simulation</i>	37.5°W-78°E and 12-60°N
<i>Meteorological initial fields</i>	NCEP (GFS)
<i>Emission scheme</i>	Horizontal mass flux of Owen (1964), threshold friction velocity from Marticorena and Bergametti (1995), drag partition of Raupach et al. (1993) as in Darnenova et al. (2009) and sandblasting efficiency of Alfaro and Gomes (2001). <sup>□</sup>
<i>Time step</i>	Variable, depending on CFL criterion
<i>Horizontal resolution</i>	18km
<i>Vertical resolution</i>	18 layers up to 100hPa
<i>Height first layer</i>	30 m above ground level (approx.)
<i>Radiation interactions</i>	No
<i>Transport size bins</i>	2 bins (0.036-2.5 µm and 2.5-10 µm in diameter)
<i>Data assimilation</i>	No
<i>Model original coordinates</i>	Lambert Conformal Conic
<i>Dust outputs parameters</i>	
<i>SCONC_DUST</i>	Total dust mass concentration present in the first model layer.
<i>OD550_DUST</i>	Calculated (offline) from dust load, applying the mass extinction efficiencies from IMPROVE algorithm (Malm and Hand, 2007, Pitchford et al., 2007).
<i>Model output</i>	NetCDF Regular Lat-Lon. Distance-weighted interpolation. Longitude: 525 grid points (25°W-60°E vector in inc = 0.162°) Latitude: 297 grid points (16°N-60°N vector in inc = 0.162°) 1-hourly vector starting at 00UTC (with 72h dust forecast) Variables: SCONC_DUST, OD550_DUST, LOAD_DUST
<i>References</i>	Liora et al. (2015), Kontos et al. (2018)

### 7.1.19. ZAMG-WRF-CHEM

<i>Model</i>	<i>WRF-Chem</i>
<i>Institution</i>	<i>ZAMG</i>
<i>Meteorological driver</i>	<i>WRF, online-coupled model with IFS forecasts used as initial and boundary conditions (3-hourly resolution)</i>
<i>Domain of simulation</i>	<i>Regional domain (0-65°N, 25°W-65°E)</i>
<i>Meteorological initial fields</i>	<i>IFS forecasts</i>
<i>Emission scheme</i>	<i>AFWA dust emission scheme for the GOCART aerosol model (LeGrand et al. 2019), tuning factors for friction velocity, soil moisture, preferential dust source term, and bulk vertical dust emission flux activated</i>
<i>Time step</i>	<i>90 seconds</i>
<i>Horizontal resolution</i>	<i>0.2° latitude x 0.2° longitude</i>
<i>Vertical resolution</i>	<i>47 vertical eta levels, model top at 50 hPa</i>
<i>Height first layer</i>	<i>~25 m above the surface</i>
<i>Radiation interactions</i>	<i>Not activated</i>
<i>Transport size bins</i>	<i>5 dust bins, log-normal size distribution; effective radii of 0.73 µm, 1.4 µm, 2.4 µm, 4.5 µm, and 8 µm</i>
<i>Data assimilation</i>	<i>Currently not activated (assimilation of MODIS AOD and ground-based PM2.5 measurements possible)</i>
<i>Model original coordinates</i>	<i>Regular latitude-longitude grid</i>
<i>Dust output parameters</i>	
<i>SCONC_DUST</i>	<i>Total dust mass concentration at the first model layer above the topography.</i>
<i>AOD550_DUST</i>	<i>AOD is calculated per layer based on mass extinction coefficients for mass concentrations per mode, then summed to obtain total column AOD.</i>
<i>Model output for WMO SDS-WAS</i>	<i>File format: netCDF Grid: regular latitude-longitude Longitude: 450 grid points Latitude: 325 grid points Time: 72 time steps, 3-hourly vector starting at 00 UTC Variables: SCONC_DUST, OD550_DUST</i>
<i>References</i>	<i>Grell et al. (2005); LeGrand et al. (2019)</i>

### 7.1.20. MOCAGE

<i>Model</i>	MOCAGE
<i>Institution</i>	METEO FRANCE
<i>Meteorological driver</i>	ARPEGE (METEO FRANCE NWP Model)
<i>Domain of simulation</i>	Global
<i>Meteorological initial fields</i>	ARPEGE
<i>Emission scheme</i>	Marticorena and Bergametti (1995)
<i>Time step</i>	Advection time step : 1h / Chemical time step : 15min
<i>Horizontal resolution</i>	1°
<i>Vertical resolution</i>	47 levels
<i>Height first layer</i>	~20m
<i>Radiation interactions</i>	N/A
<i>Transport size bins</i>	6 bins (2.0E-3, 0.01, 0.1, 1, 2.5, 10, 50 microns)
<i>Data assimilation</i>	Hourly 3D-VAR assimilating AOD 550nm from MODIS (on Terra/Aqua satellites) and VIIRS (on NPP and NOAA20 satellites) instruments
<i>Model original coordinates</i>	1° x 1° regular grid
<i>Dust output parameters</i>	
<i>SCONC_DUST</i>	Total dust mass concentration present in the first model layer
<i>AOD550_DUST</i>	Dust AOD at 550nm
<i>Model output for WMO SDS-WAS</i>	File format: NetCDF Grid: Regular Lat-Lon Region : Lon : -25°E-65°E ; Lat : 0°N:65°N Resolution 1° Time: Instantaneous values every 3hours ; validity time up to +72h, one production per day : basetime D-day 00hutc Variables: SCONC_DUST, OD550_DUST
<i>References</i>	Martet et al (2009), Sic et al (2015), Guth et al (2016), Sic et al (2016), El Amraoui et al (2022)
